Methylphenidate is effective in reducing the symptoms of attention deficit hyperactivity disorder (ADHD) in children and adolescents and improving their functioning. There is limited evidence, however, regarding the efficacy and safety of extended-release (XR) methylphenidate compared with placebo in the treatment of ADHD in children. This 12-week, randomized, double-blind, placebo-controlled, multi-centre clinical trial assessed the efficacy and safety of XR methylphenidate (Avant; Shire) in the treatment of ADHD in children. Patients (n=138) aged 6-11 years were randomized in a 1:1 ratio to receive XR methylphenidate (0.5-7.5 mg/day) or placebo for 12 weeks. The primary efficacy variable was the ADHD Rating Scale, Version IV (ADHD-RS-IV) total score. The secondary efficacy measures were the Clinical Global Impressions-ADHD-S c6a93da74d
